## The Skyus Connects EnerNOC's Smart Energy Solution

Energy intelligence software provider EnerNOC is helping customers make the most of every kilowatt with its 24/7/365 network that connects enterprise customers, utility companies, and grid operators with real-time data on energy consumption. EnerNOC uses FW's cost-effective Skyus embedded modem to bring data from meters in the field to its Network Operations Center (NOC).

Connected to utility meters at customer sites, the Skyus provides the connection for EnerNOC's data collectors, sending real-time energy information to the NOC. EnerNOC monitors energy consumption levels and in certain situations notifies customers of impending increases in demand on the grid. Energy data is used to help customers rein in energy costs and help utility companies reduce strain on the grid.

The Skyus' industrial grade temperature range and durability enable it to thrive in extreme environments, making it ideal for the continuous operation EnerNOC requires.

With the help of the Skyus, EnerNOC's customers are able to identify waste, use less energy, and reduce environmental impact.
